

Dear Editor,

Please find attached our manuscript titled “Concept-Guided Urban Environment Risk Prediction from Street-Level Imagery Using Vision–Language Models” for consideration for publication in your journal.

In this work, we present a concept-guided framework for analyzing urban street scenes using street-level imagery and pretrained vision–language models. Instead of relying only on deep feature embeddings, the proposed method extracts interpretable urban concepts such as greenery, vacant buildings, and commercial activity, and uses them for classification. The study focuses on building an approach that is both computationally efficient and easier to interpret compared to traditional black-box deep learning models.

The experiments were conducted using images from the MIT Place Pulse dataset. The proposed method achieved strong classification performance while requiring minimal computational resources. We believe the work may be useful for researchers working in computer vision, urban computing, interpretable machine learning, and urban analytics.

This manuscript is original, has not been published previously, and is not under consideration for publication elsewhere.

Thank you for your time and consideration. We appreciate the opportunity to submit our work to your journal, and we look forward to hearing from you.

Sincerely,

Himanshu Dwivedi

Lecturer in Computer Science, Directorate of Education, Delhi Govt.
